Task 4 – Routing

Create a new application with the routing option to configure the application to use the Router module.

Add a navigation bar at the top of the page. The navigation bar should have a link for the homepage, an about us page and a users' page.

In the users' page, display a list of all users (same as the previous task). When you click on a specific user, you should navigate to a user details page where you will display all of the selected user's data.

This page should have a back button that will navigate to the previous page (users list).

The user details page will have two tabs; details and posts.

The details tab will display the user information.

The posts tab will display this user's posts. You can add, edit and delete posts.

Handle the case when the user tries to navigate to routes that don't exist.

Configure the default route to navigate to the homepage.
