Task 6

Part 1:

Redo task 5 with reactive forms instead of template-driven forms.

Add the following validations to the fields:

- Required for the first name, last name and email fields.
- Minimum length of 2 characters for the first name and last name fields.
- Add email validation on the email field.
- Create a custom validator to prevent submitting a user when their first name is the same as their last name.

Show the appropriate messages for each error.

Part 2:

Create forms to create and update posts using reactive forms.

- Add the appropriate validations; do what the models say.
- For the owner field, show the owner's name in a disabled input field.
- Remember to send the owner's id when creating a post and don't send it when updating a post.
- Don't disable the submit button, show the appropriate error messages when a user tries to submit an invalid form. But don't send Http request with invalid data (when the form is invalid).
- For tags, use a FormArray instance.
